

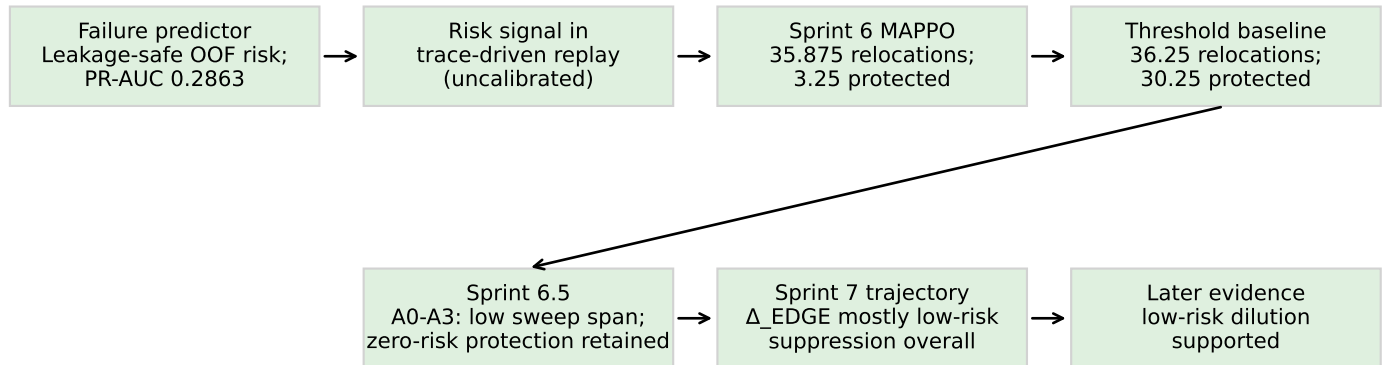

Figure 12. Completed evidence chain for DT-MARL-Healthcare

Established findings

- The threshold rule outperformed MAPPO on held-out protection at comparable migration volume.
- A0 reproduced the retained Sprint 6 behavior; the R2 trajectory was scored on frozen sets.
- Net Δ_EDGE growth is mostly low-risk suppression; u042-u062 includes a documented high-risk acquisition phase.

Ruled out / downgraded: reward absence, representation incapacity, simple variance explanation, and saturation as the primary cause.

Unresolved: causal account of $R2 > R3$; multi-seed generalization; FLOPs/execution-complexity claims.
